

Brüel & Kjær Vibro

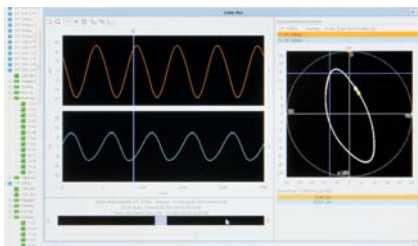

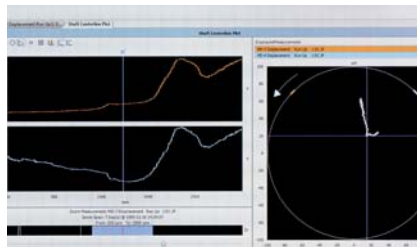

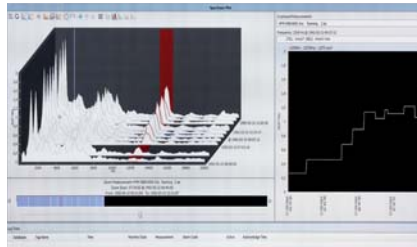

Compass 6000™ Condition Monitoring System Benefits of New Version 10

Pointing the way to maximized machine uptime!

Compass 6000™ Condition Monitoring System

Version 10: Faster, simpler and more flexible

Compass 6000™ and its family of systems have been Brüel & Kjær Vibro's flagship condition monitoring platforms for over 25 years. Many plants around the world within the energy, petrochemical and process industries have been depending on Compass – and for good reason. The comprehensive, scalable condition monitoring and diagnostic capability offered by the systems has been successfully ensuring machine production, reliability and efficiency is maximized while machine life cycle costs minimized.

The newest release dramatically increases performance without changing the basic functionality or concept. Compass 6000™ still uses the Brüel & Kjær Vibro VIBROCONTROL 6000® protection system for data acquisition, but extra versatility is provided by the new Condition Monitoring Interface VI-6080 to enable the system to be used with almost any machine protection system with buffered outputs.

The new operating system and SQL database server on Microsoft Windows® extends data management capability, simplifies installation, optimizes data security and increases processing speed. Server hardware, licensing and overall IT maintenance requirements are now much more cost-effective. For existing customers, the new upgrade is compatible with Compass UNIX-based systems, and requires no additional training.

Do you want to find out how Compass 6000™ can benefit your plant? Contact us to find out more at www.bkvibro.com.

★ Highlights

- Highly flexible user-defined data storage, compression and other data management services
- Simplified licensing and installation
- Operating system and SQL database on Microsoft Windows®
- Supports all widely used Windows® desktop and server operating systems, including Windows® 10
- Database backup without interrupting monitoring
- Runs on most server platforms. Simple PC solution for small systems available.
- Supports the newly developed Condition Monitoring Interface VI-6080
